## ASSIGNMENTS

## ASSIGNMENT - 1

1. i) One kg of air is expanded in piston-cylinder system from a specific volume of $\mathrm{v}=0.2 \mathrm{~m}^{3} / \mathrm{kg}$ and temperature of 580 K to a specific volume of $\mathrm{v}=0.8 \mathrm{~m}^{3} / \mathrm{kg}$ and a temperature of 290 K . The expansion process is given by $\mathrm{pv}^{1.5}=0.75$ ( p in bar and v in $\mathrm{m}^{3} / \mathrm{kg}$ ). Determine the work and heat interaction. (8)
ii) Give the expression for work done during the following reversible expansion processes, isothermal and adiabatic. (5)
2. Air enters a compressor at $10^{5} \mathrm{~Pa}$ and $25^{\circ} \mathrm{C}$ having volume of $1.8 \mathrm{~m}^{3} / \mathrm{kg}$ and it compressed to $5 \times 10^{5} \mathrm{~Pa}$ isothermally, determine
i) Work done
ii) Change in internal energy
iii) Heat supplied.
3. A unit mass of Nitrogen gas undergoes an expansion process as per the relation $\mathrm{P}=\mathrm{aV}+\mathrm{bV}{ }^{2}$ where a $=1.1 \mathrm{bar} / \mathrm{m}^{3}$ and b is a constant $\left(\mathrm{bar} / \mathrm{m}^{6}\right)$, from an initial pressure of 15 bar and temperature $100^{\circ} \mathrm{C}$ to a final volume of 100 liters. Calculate the displacement work done by the gas and also the heat exchange with the surroundings if the container walls are not insulated. Given Specific heat at constant volume as $0.7 \mathrm{~kJ} / \mathrm{kgK}$.
4. 85 kJ of heat is supplied to a system at constant volume. The system rejects 90 kJ of heat at constant pressure and 20 kJ of work is done on it. The system is brought to its original state by an adiabatic process. Determine also the value of internal energy at all end states if initial value is 100 kJ . (13)
5. One kg of air is expanded at a constant pressure of 2.5 bar from a volume of $0.3 \mathrm{~m}^{3}$ to a volume of $0.45 \mathrm{~m}^{3}$ Find (1) external work done by the gas; (ii) internal energy of the gas; and (iii) heat transferred during the process.

## ASSIGNMENT - 2

1. i) Explain the process involved in Carnot cycle with neat P-V and T-S diagram and obtain an expression for Carnot efficiency.
ii) 10 Kg metal piece with constant specific heat of $0.9 \mathrm{~kJ} / \mathrm{kg}-\mathrm{K}$ at $200^{\circ} \mathrm{C}$ is dropped into an insulated tank which contains 100 kg of water at $20^{\circ} \mathrm{C}$. Determine the final equilibrium temperature and the total changes in entropy for the process.
2. i) Show that heat transfer through a finite temperature difference is irreversible. (6)
(ii) Which is the more effective way to increase the efficiency of a Carnot engine: to increase $\mathrm{T}_{1}$ keeping $\mathrm{T}_{2}$ constant: or to decrease $\mathrm{T}_{2}$, keeping $\mathrm{T}_{1}$ constant? (7)
3. A fish freezing plant requires 50 tons of refrigeration. The freezing temperature is $-10^{0} \mathrm{C}$ while the temperature is $35^{\circ} \mathrm{C}$. If the performance of the plant is $15 \%$ of the theoretical reversed Carnot cycle working within the same temperature limits, calculate the power required. Take 1 ton $=210$ $\mathrm{kJ} / \mathrm{min}$. (13)
4. A rigid cylinder containing $0.006 \mathrm{~m}^{3}$ of nitrogen (molecular weight 28) at $1.04 \mathrm{bar}, 15^{0} \mathrm{C}$ is heated reversibly until the temperature is $90^{\circ} \mathrm{C}$. Calculate the change of entropy and the heat supplied. Sketch the process on the T-S diagram. Take the isentropic index, $\gamma$, for nitrogen as 1.4, and assume that nitrogen is a perfect gas. (13)
5. A reversible heat engine operates between two reservoirs at temperatures of $600^{\circ} \mathrm{C}$ and $40^{\circ} \mathrm{C}$. The engine drives a reversible refrigerator which operates between reservoirs at temperatures of $40^{\circ} \mathrm{C}$ and $-20^{\circ} \mathrm{C}$. The heat transfer to the heat engine is 2000 kJ and the network output for the combined engine v refrigerator is 360 kJ . (i) Calculate the heat transfer to the refrigerant and the net heat transfer to the reservoir at $40^{\circ} \mathrm{C}$. (ii) Reconsider (i) given that the efficiency of the heat engine and the C.O.P. of the refrigerator are each 40 per cent of their maximum possible values

#### Abstract

ASSIGNMENT - 3 1. An I.C. engine operating on the dual cycle (limited pressure cycle) the temperature of the working fluid (air) at the beginning of compression is $27^{\circ} \mathrm{C}$. The ratio of the maximum and minimum pressures of the cycle is 70 and the compression ratio is 15 . The amounts of heat added at constant volume and at constant pressure are equal. Compute the air standard thermal efficiency of the cycle. Take $7=1.4$ for air. (13)

2. What is an Otto cycle? Show that the efficiency of the Otto cycle depends only on the compression ratio. (7)
(ii) Derive an expression of optimum pressure ratio for maximum network output in an ideal corresponding cycle efficiency?
3. (i) A gas-turbine power plant operating on an ideal Brayton cycle has a pressure ratio of 8 . The gas temperature is 300 K at the compressor inlet and 1300 K at the turbine inlet. Utilizing the airstandard assumptions, determine
(1) the gas temperature at the exits of the compressor and the turbine
(2) the back work ratio, and
(3) the thermal efficiency.
4. An engine working on the Otto cycle is supplied with air at $0.1 \mathrm{Mpa}, 35^{\circ} \mathrm{C}$. The compression ratio is 10 . Heat supplied is $2400 \mathrm{~kJ} / \mathrm{kg}$. Calculate the maximum pressure and temperature of the cycle, the cycle efficiency and the mean effective pressure. (Take for air $\mathrm{Cp}=1,005 \mathrm{~kJ} / \mathrm{kgK}, \mathrm{Cv}=$ $0.718 \mathrm{~kJ} / \mathrm{kg}$ and $\mathrm{R}=0.287 \mathrm{~kJ} / \mathrm{kg} \mathrm{K})$.
5. An air-standard Diesel cycle has a compression ratio of 18 , and the heat transferred to the working fluid per cycle is $1800 \mathrm{~kJ} / \mathrm{kg}$. At the beginning of the compression stroke, the pressure is I bar and the temperature is 300 K . Calculate: (i) Thermal efficiency, (ii) The mean effective pressure.

## ASSIGNMENT - 4

1. Steam is initially at $1.5 \mathrm{MPa}, 300^{\circ} \mathrm{C}$ expands reversibly and adiabatically in a steam turbine to $40^{\circ} \mathrm{C}$. Determine the ideal work output of the turbine per kg of steam. Sketch the process in T-s and h -s diagrams. (13)
2. A rigid tank of 0.03 m 3 volume contains a mixture of liquid water and water vapor at 80 kPa . The mass of the mixture in the tank is 12 kg . Calculate the heat added and quality of the mixture when the pressure inside the tank is raised to 7 MPa .
3. i) Describe a simple ideal Rankine cycle with a schematic diagram. Explain the processes involved by T-s diagram. (6)
(ii) A Steam power plant operates between a boiler pressure of 4 MPa and $300^{\circ} \mathrm{C}$ and a condenser pressure of 50 kPa . Determine the thermal efficiency of the cycle assuming the cycle to be a simple ideal Rankine cycle.
4. i) A pressure cooker contains 1.5 kg of steam at 5 bar and 0.9 dryness when the gas was switched off. Determine the quantity of heat rejected by the 'pressure cooker when the pressure in the cooker falls to 1 bar. (7)
(ii) Steam at 19 bar is throttled to 1 bar and the temperature after throttling is found to be $150^{\circ} \mathrm{C}$. Calculate the initial dryness fraction of the steam.
5. A steam power station uses the following cycle:

Steam at boiler outlet $-150 \mathrm{bar}, 550^{\circ} \mathrm{C}$
Reheat at 40 bar to $550^{\circ} \mathrm{C}$
Condenser at 0.1 bar.
Using the Mollier chart and assuming ideal processes, find the
i) quality at turbine exhaust, (4)
ii) cycle efficiency, and (4)
iii) steam rate. (5)

## ASSIGNMENT - 5

1. Air enters a compressor operating at steady state at a pressure of 1 bar, a temperature of 290 K and a velocity of $6 \mathrm{~m} / \mathrm{s}$ through an inlet with an area of 0.1 m 2 . At the exit, the pressure is 8 bar, the temperature is 450 K and the velocity is $2 \mathrm{~m} / \mathrm{s}$. Heat transfer from the compressor to the surroundings occurs at the rate of $180 \mathrm{~kJ} / \mathrm{min}$. Employing the ideal gas model, calculate the power input to the compressor. (7)
2. A reactor's wall 320 mm thick is made tip of an inner layer of firebrick ( $\mathrm{k}=0.84 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ ) covered with a layer of insulation $\left(\mathrm{k}=0.16 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}\right)$. The reactor operates at a temperature of $1325^{\circ} \mathrm{C}$ and the ambient temperature is $25^{\circ} \mathrm{C}$. (i) Determine the thickness of firebrick and insulation which gives minimum heat loss, and (ii) Calculate the heat loss presuming that the insulating material has a maximum temperature of $1200^{\circ} \mathrm{C}$. (13)
3. State Planck's laws of radiation and prove that the value of Stefan-Boltzmann constant is 5.67 x $10^{8} \mathrm{~W} / \mathrm{m}^{2}-\mathrm{K}^{4}$.
4. An aircraft flies at $90 \mathrm{~km} / \mathrm{hr}$. One of its turbojet engines takes in $40 \mathrm{~kg} / \mathrm{s}$ of air and expands the gases to the ambient pressure. The air-fuel ratio is 50 and the lower calorific value of the fuel is $43 \mathrm{MJ} / \mathrm{kg}$. For maximum thrust power, determine: jet velocity, thrust, specific thrust, thrust power, propulsive and thermal efficiencies. (13)
5. A room is maintained at $27^{\circ} \mathrm{C}$ while the surroundings are at $2^{\circ} \mathrm{C}$. the temperature of the inner and outer surfaces of the wall ( $\mathrm{k}=0.71 \mathrm{~W} / \mathrm{mK}$ ) are measured to be $21^{\circ} \mathrm{C}$ and $6^{\circ} \mathrm{C}$ respectively. Heat flows steadily through the wall 5 mx 7 m in cross-section and 0.32 m in thickness. Determine (i) the rate of heat transfer through the wall, (ii) the rate of entropy generation in the wall, and (iii) the rate of total entropy generation with this heat transfer process.

## QUESTION BANK

## Subject Code \& Name: AE3351 - AERO ENGINEERING THERMODYNAMICS

Year / Sem : II / III

| UNIT I - FUNDAMENTAL CONCEPT AND FIRST LAW |  |  |  |
| :---: | :--- | :---: | :--- |
| Q. No | Question | BT <br> Level | Competence |
|  |  |  |  |
| 1. | Bring out the differences between microscopic and macroscopic <br> modes in thermodynamic studies | L2 | Understanding |
| 2. | What is the difference between a nozzle flow and a throttle process? | L2 | Understanding |
| 3. | How the properties are classified? | L1 | Remembering |
| 4. | What is meant by quasi-equilibrium process? | L1 | Remembering |
| 5. | State the conditions for thermodynamic equilibrium of a system. | L1 | Remembering |
| 6. | Differentiate between intensive and extensive properties. | L1 | Remembering |
| 7. | A mixture of gasses expands from 0.03 m ${ }^{3}$ to 0.06 m ${ }^{3}$ at a constant <br> pressure of 1 MPa and absorbs 84 KJ of heat during the process. Find <br> the change of the internal energy of the mixture. | L2 | Understanding |
| 8. | Define insulated system. | L1 | Remembering |
| 9. | Define Polytropic process. | L1 | Remembering |
| 10. | Define the Perpetual Motion Machine of the first kind. | L1 | Remembering |
| 11. | What is the difference between working substance and pure <br> substance? | L1 | Remembering |
| 12. | State the principle of thermometry How it is used for the <br> measurement of temperatures? | L1 | Remembering |
| 13. | What are the differences between the boundaries of a closed system <br> and a control volume? | L1 | Remembering |
| 14. | Temperature measurement is based on which law of <br> thermodynamics? State the law. | L1 | Remembering |
| 15. | Differentiate the sensible energy and latent energy. | L1 | Remembering |
| 16. | What are the deficiencies of first law of thermodynamics? | L2 | Understanding |
| 17. | Discuss briefly about thermodynamic system and its types? | L1 | Remembering |
| 18. | Define Continuum? | L1 | Remembering |
| 19. | What is system and surrounding? | L1 | Remembering |
| 20. | Distinguish between the Open and Closed system? | L1 | Remembering |
| 21. | Define Isolated system? | L1 | Remembering |
| 22. | Define properties of the system? | L1 | Remembering |
| 23. | What is the change of state of a system? | L1 | Remembering |
| 24. | Distinguish between the Homogeneous and Heterogeneous system? | L1 | Remembering |
| 25. | What is a point function and path functions? Give examples. | L2 | Understanding |
| 26. | What is meant by a diathermic wall? | L2 | Understanding |
| 27. | Define Specific heat and Latent Heat? | L2 | Understanding |
| 28. | State First Law of thermodynamics. | L1 | Remembering |

| PART - B |  |  |  |
| :---: | :---: | :---: | :---: |
| 1. | (i) A piston-cylinder containing air expands at a constant pressure of 150 kPa from a temperature of 285 K to a temperature of 550 K . The mass of air in the cylinder is 0.05 kg . Determine the system heat and work for the process as well as the net work available if the surrounding pressure acting on the piston is 101.3 kPa . (8) <br> (ii) Explain in detail about the types of thermodynamic equilibrium. (5) | L3 | Apply |
| 2. | (i) In a remote area, water is to be supplied from underground water source, whose free surface is 100 m below ground level, using a water pump. This water is to be stored in a water tank at a height of 10 m from the ground level. This pump is connected with an inlet pipe of diameter 20 cm and outlet pipe of diameter 30 cm . Determine the power input to this pump for steady water supply of $20 \mathrm{I} / \mathrm{s}$. Assume no heat interaction during this process. (8) <br> (ii) State Zeroth law of thermodynamics and demonstrate it with neat illustration. (5) | L3 | Apply |
| 3. | i) One kg of air is expanded in piston-cylinder system from a specific volume of $\mathrm{v}=0.2 \mathrm{~m}^{3} / \mathrm{kg}$ and temperature of 580 K to a specific volume of $v=0.8 \mathrm{~m}^{3} / \mathrm{kg}$ and a temperature of 290 K . The expansion process is given by $\mathrm{pv}^{1.5}=0.75$ ( p in bar and v in $\mathrm{m}^{3} / \mathrm{kg}$ ). Determine the work and heat interaction. (8) <br> ii) Give the expression for work done during the following reversible expansion processes, isothermal and adiabatic. (5) | L3 | Apply |
| 4. | i) An adiabatic air compressor compresses 10 lit/s of air at 120 KPa and $20^{\circ} \mathrm{C}$ to 1000 KPa and $300^{\circ} \mathrm{C}$.. Determine the work required by the compressor in $\mathrm{kJ} / \mathrm{kg}$, and the power required to drive the air compressor in kW . (8) <br> ii) Nitrogen gas flows into a convergent nozzle at $200 \mathrm{kPa}, 400 \mathrm{~K}$ and very low velocity. It flows out of the nozzle at $100 \mathrm{kPa}, 330 \mathrm{~K}$. If the nozzle is insulated, find the exit velocity. (5) | L3 | Apply |
| 5. | In an air compressor air flows steadily at the rate of $0.5 \mathrm{~kg} / \mathrm{s}$ through an air compressor. It enters the compressor at $6 \mathrm{~m} / \mathrm{s}$ with a pressure of 1 bar and a specific volume of $0.85 \mathrm{~m}^{3} / \mathrm{kg}$ and leaves at $5 \mathrm{~m} / \mathrm{s}$ with a pressure of 7 bar and a specific volume of $0.16 \mathrm{~m}^{3} / \mathrm{kg}$. The internal energy of the air leaving is $90 \mathrm{~kJ} / \mathrm{kg}$ greater than that of the air entering. Cooling water in a jacket surrounding the cylinder absorbs heat from the air at the rate of $60 \mathrm{~kJ} / \mathrm{s}$. Calculate <br> (i) The power required to drive the compressor. (8) <br> (ii) The inlet and output pipe cross-sectional areas. (5) | L3 | Apply |
| 6. | (i) The following data refer to a 12 -cylinder single acting and two stroke marine diesel engine: Speed 150 rpm , cylinder diameter $=0.8$ m , stroke of the piston $=1.2 \mathrm{~m}$. area of the indicator diagram 5.5 x $104 \mathrm{~m}^{2}$, length of the diagram 0.06 m . Spring value $=147$ MPa per m . Find the net rate of work transfer from the gas to the piston in kW . (8) (ii) Make a comparison between heat and work. (5) | L3 | Apply |
| 7. | State the first law of thermodynamics and prove that for a non flow process, it leads to the energy equation $\mathrm{Q}=\Delta \mathrm{U}+\mathrm{W}$ | L2 | Understanding |
| 8. | Air enters a compressor at $10^{5} \mathrm{~Pa}$ and $25^{\circ} \mathrm{C}$ having volume of $1.8 \mathrm{~m}^{3} / \mathrm{kg}$ and it compressed to $5 \times 10^{5} \mathrm{~Pa}$ isothermally, determine | L3 | Apply |

|  | i) Work done <br> ii) Change in internal energy <br> iii) Heat supplied. |  |  |
| :---: | :---: | :---: | :---: |
| 9. | A closed system undergoes a cycle consisting of two processes. During the first process 40 kJ of heat is transferred to the system while the system does 60 kJ of work. During the second process, 40 kJ of work is done on the system. Determine the heat transfer during the process and network and heat transfer for the cycle. | L3 | Apply |
| 10. | What are steady flow engineering devices? Obtain steady flow energy equation for these devices. | L2 | Understanding |
| 11. | A highly elastic ball released from rest from an initial height of $z_{o} m$, bounces a large number of times on a rigid horizontal surface before coming to rest such that the height attained after each bounce is ' $\varphi$ ' times the height before the bounce $(\varphi<1)$. The surface of the plane is adiabatic and the ball is made of a diathermic material with mass ' m ' and specific heat ' $c$ '. Derive an expression for the temperature rise " $\Delta \mathrm{T}$ " of the ball after " X " number of bounces. | L3 | Apply |
| 12. | A unit mass of Nitrogen gas undergoes an expansion process as per the relation $\mathrm{P}=\mathrm{aV}+\mathrm{bV}^{2}$ where $\mathrm{a}=1.1 \mathrm{bar} / \mathrm{m}^{3}$ and b is a constant $\left(\mathrm{bar} / \mathrm{m}^{6}\right)$, from an initial pressure of 15 bar and temperature $100^{\circ} \mathrm{C}$ to a final volume of 100 liters. Calculate the displacement work done by the gas and also the heat exchange with the surroundings if the container walls are not insulated. Given Specific heat at constant volume as $0.7 \mathrm{~kJ} / \mathrm{kgK}$. | L3 | Apply |
| 13. | (i) In a gas turbine the gas enters at the rate of $5 \mathrm{~kg} / \mathrm{s}$ with a velocity of $50 \mathrm{~m} / \mathrm{s}$ and enthalpy of $900 \mathrm{~kJ} / \mathrm{kg}$ leaves the turbine with a velocity of $150 \mathrm{~m} / \mathrm{s}$ and enthalpy of $400 \mathrm{~kJ} / \mathrm{kg}$. The loss of heat from the gases to the surroundings is $25 \mathrm{~kJ} / \mathrm{kg}$. Assume for gas $\mathrm{R}=0.285 \mathrm{~kJ} / \mathrm{kgK}$ and $\mathrm{Cp}=1.004 \mathrm{~kJ} / \mathrm{kgK}$ and inlet conditions to be at 100 kPa and $27^{\circ} \mathrm{C}$. Determine the power output of the turbine. (8) <br> (ii) Air at 500 kPa is expanded to 100 kPa in two steady flow cases. Case one is a nozzle and case two is a turbine, the exit state is the same for both cases. What can you say about the specific turbine work relative to the specific kinetic energy in the exit flow of the nozzle? | L3 | Apply |
| 14. | (i) A piston cylinder contains 0.1 kg nitrogen at $100 \mathrm{kPa}, 27^{\circ} \mathrm{C}$ and it is now compressed in a polytropic process with $\mathrm{n}=1.25$ to a pressure of 250 kPa . Find the heat transfer. (8) <br> (ii) A piston cylinder contains 0.5 kg air at $500 \mathrm{kPa}, 500 \mathrm{~K}$. The air expands in a process so P is linearly decreasing with volume to a final state of $100 \mathrm{kPa}, 300 \mathrm{~K}$. Find the work in the process. (5) | L3 | Apply |
|  | Explain the adiabatic process. Derive an expression for the work done during the adiabatic compression and expansion of an ideal gas. | L2 | Understanding |
| 15. | A system contains $0.15 \mathrm{~m}^{3}$ of a gas at a pressure of 3.8 bar and $150^{\circ} \mathrm{C}$. It is expanded adiabatically till the pressure falls to 1 bar . The gas is then heated at a constant pressure till its enthalpy increases by 70 kJ . Determine the work done. Take $\mathrm{Cp}=1 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ and $\mathrm{Cv}=0.714$ $\mathrm{kJ} / \mathrm{kg}$ K. | L3 | Apply |
| 16. | i) A fluid at a pressure of 3 bar and with specific volume of 0.18 $\mathrm{m}^{3} / \mathrm{kg}$, contained in a cylinder behind a piston expands reversibly to a | L3 | Apply |

|  | pressure of 0.6 bar according to a law, $\mathrm{P}=\mathrm{C} / \mathrm{v}^{2}$ where C is a constant. Calculate the work done by the fluid on the piston. (7) <br> ii) Derive the expression for work done by an adiabatic expansion process and state the relationship between P-V-T for an adiabatic process. (6) |  |  |
| :---: | :---: | :---: | :---: |
| 17. | Air at a temperature of $20^{\circ} \mathrm{C}$ passes through a heat exchanger at a velocity of $40 \mathrm{~m} / \mathrm{s}$ where its temperature is raised to $820^{\circ} \mathrm{C}$. It then enters a turbine with same velocity of $40 \mathrm{~m} / \mathrm{s}$ and expands till the temperature falls to $620^{\circ} \mathrm{C}$. On leaving the turbine, the air is taken at a velocity of $55 \mathrm{~m} / \mathrm{s}$ to a nozzle where it expands until the temperature has fallen to $510^{\circ} \mathrm{C}$. If the air flow rate is $2.5 \mathrm{~kg} / \mathrm{s}$, calculate: <br> i) Rate of heat transfer to the air in the heat exchanger (4) <br> ii) The power output from the turbine, assuming no heat loss (4) <br> iii) The velocity at exit from the nozzle, assuming no heat loss. (5) | L3 | Apply |
| 18. | 85 kJ of heat is supplied to a system at constant volume. The system rejects 90 kJ of heat at constant pressure and 20 kJ of work is done on it. The system is brought to its original state by an adiabatic process. Determine also the value of internal energy at all end states if initial value is 100 kJ . (13) | L3 | Apply |
| 19. | One kg of air is expanded at a constant pressure of 2.5 bar from a volume of $0.3 \mathrm{~m}^{3}$ to a volume of $0.45 \mathrm{~m}^{3}$ Find (1) external work done by the gas; (ii) internal energy of the gas; and (iii) heat transferred during the process. | L3 | Apply |
| 20. | $0.016 \mathrm{~m}^{3}$ gas at constant pressure $2055 \mathrm{kN} / \mathrm{m}^{3}$ expands to a pressure of $215 \mathrm{kN} / \mathrm{m}^{2}$ by following the law $\mathrm{pv}^{1.35}=\mathrm{C}$ Determine the work done by the gas during expansion process. | L3 | Apply |
| PART - C |  |  |  |
| 1. | (i) Air expands through a turbine from $500 \mathrm{kPa}, 520^{\circ} \mathrm{C}$ to 100 kPa , $300^{\circ} \mathrm{C}$. During expansion $10 \mathrm{~kJ} / \mathrm{kg}-\mathrm{K}$ of heat is lost to the surroundings which is at $98 \mathrm{kPa}, 20^{\circ} \mathrm{C}$. Neglecting the K.E and P.E changes, determine per kg of air <br> (1) the decrease in availability, <br> (2) the maximum work and <br> (3) the irreversibility. (8) <br> (ii) Air enters a compressor operating at steady state at a pressure of 1 bar, a temperature of 290 K and a velocity of $6 \mathrm{~m} / \mathrm{s}$ through an inlet with an area of $0.1 \mathrm{~m}^{2}$. At the exit, the pressure is 8 bar, the temperature is 450 K and the velocity is $2 \mathrm{~m} / \mathrm{s}$. Heat transfer from the compressor to the surroundings occurs at the rate of $180 \mathrm{~kJ} / \mathrm{min}$. Employing the ideal gas model, calculate the power input to the compressor. (7) | L3 | Apply |
| 2. | A quantity of gas occupies a volume of $0.4 \mathrm{~m}^{3}$ at a pressure of 100 $\mathrm{kN} / \mathrm{m}^{2}$ and a temperature of $20^{\circ} \mathrm{C}$. The gas is compressed isothermally to a pressure $450 \mathrm{kN} / \mathrm{m}^{2}$ and then expanded adiabatically to its initial volume. Determine, for this quantity of gas : <br> i) The heat transferred during the compression, (5) <br> ii) The change of internal energy during the expansion, (5) <br> iii) The mass of gas. (5) | L3 | Apply |

UNIT II - SECOND LAW AND ENTROPY

| Q. No | Question | $\begin{gathered} \text { BT } \\ \text { Level } \end{gathered}$ | Competence |
| :---: | :---: | :---: | :---: |
| PART - A |  |  |  |
| 1. | Compare two heat engines receiving the same Q , one at 1200 K and the other at 1800 K , they both reject heat at 500 K . Which one is better? | L2 | Understanding |
| 2. | What is meant by Clausius inequality? | L2 | Understanding |
| 3. | Define reversibilities. | L1 | Remembering |
| 4. | State Clausius inequality for a cyclic process. | L1 | Remembering |
| 5. | Give some examples of ideal reversible processes. | L2 | Understanding |
| 6. | Summarize the characteristics of entropy. | L1 | Remembering |
| 7. | What are PMM1 and PMM2? | L1 | Remembering |
| 8. | What is heat pump? | L2 | Understanding |
| 9. | Define 'Entropy' | L1 | Remembering |
| 10. | Write Clausius statement of Second Law of Thermodynamics? | L1 | Remembering |
| 11. | State Kelvin-Plank statement. | L1 | Remembering |
| 12. | State thermodynamic advantage of heat pump over direct heating? | L1 | Remembering |
| 13. | State the Carnot's theorem. | L1 | Remembering |
| 14. | State the second law of thermodynamics. | L1 | Remembering |
| 15. | Why is an isentropic process not necessarily an adiabatic process? | L2 | Understanding |
| 16. | A refrigerator removes 1.5 kJ from the cold space using 1 kJ work input. How much energy goes into the kitchen and what is its coefficient of performance? | L2 | Understanding |
| 17. | Assume a heat engine with a given $\mathrm{Q}_{\mathrm{H}}$. Can you say anything about $\mathrm{Q}_{\mathrm{L}}$ if the engine is reversible? And if it is irreversible? | L2 | Understanding |
| 18. | What is a thermal energy reservoir? Give some examples | L2 | Understanding |
| 19. | What is meant by the increase of entropy principle? | L2 | Understanding |
| 20. | What do you understand by the entropy principle? | L2 | Understanding |
| 21. | What is meant by availability? | L2 | Understanding |
| 22. | What is the difference between a refrigerator and a heat pump? | L2 | Understanding |
| 23. | What are the assumptions made on heat engines? | L2 | Understanding |
| 24. | What is meant by reversible process? | L2 | Understanding |
| 25. | What is meant by irreversible process? | L2 | Understanding |
| 26. | How do you distinguish between internal and external irreversibility's? | L2 | Understanding |
| 27. | Show that the COP of a heat pump is greater than the COP of a refrigerator by unity. | L2 | Understanding |
| 28. | What is absolute entropy? | L2 | Understanding |

|  | amount of heat which, the house loses heat per minute. |  |  |
| :---: | :---: | :---: | :---: |
| 8. | i) Explain the process involved in Carnot cycle with neat P-V and T-S diagram and obtain an expression for Carnot efficiency. <br> ii) 10 Kg metal piece with constant specific heat of $0.9 \mathrm{~kJ} / \mathrm{kg}-\mathrm{K}$ at $200^{\circ} \mathrm{C}$ is dropped into an insulated tank which contains 100 kg of water at $20^{\circ} \mathrm{C}$. Determine the final equilibrium temperature and the total changes in entropy for the process. | L3 | Apply |
| 9. | Define heat engine and heat pump. Explain why the performance of heat engine is measured in terms of efficiency but that of heat pumps in terms of COP. | L3 | Apply |
| 10. | In an air turbine the air expands from 7 bar and $460^{\circ} \mathrm{C}$ to 1.012 bar and $160^{\circ} \mathrm{C}$. The heat loss from the turbine can be assumed to be negligible. <br> i) Show that the process is irreversible; <br> ii) Calculate the change of entropy per kg of air. | L3 | Apply |
| 11. | Prove that the Kelvin Planck Statement of Second law of thermodynamics is equivalent to the Clausius statement. | L3 | Apply |
| 12. | A $50-\mathrm{kg}$ block of iron block at a temperature of 500 K is cooled by dipping in a pool of water at a temperature of 285 K . The iron block eventually reaches thermal equilibrium with the pool water. Assuming an average specific heat of $0.45 \mathrm{~kJ} / \mathrm{kgK}$ for the iron, determine (i) the entropy change of the iron block, (ii) the entropy change of the pool water, and (iii) the entropy generated during this process. | L3 | Apply |
| 13. | (i) An inventor claims to have developed an engine that takes in 105 MJ at a temperature of 400 K , rejects heat at a temperature of 200 K , and delivers 17.5 kWh of mechanical work: Would you advise investing money to put this engine in market? (8 <br> (ii) Prove that the violation of Kelvin-Planck's statement violates the Clausius statement. | L3 | Apply |
| 14. | (i) Show that heat transfer through a finite temperature difference is irreversible. (6) <br> (ii) Which is the more effective way to increase the efficiency of a Carnot engine: to increase $\mathrm{T}_{1}$ keeping $\mathrm{T}_{2}$ constant: or to decrease $\mathrm{T}_{2}$, keeping $\mathrm{T}_{1}$ constant? (7) | L3 | Apply |
| 15. | A fluid undergoes a reversible adiabatic compression from 4 bar, 0.3 $\mathrm{m}^{3}$ to $0.08 \mathrm{~m}^{3}$ according to the law, $\mathrm{pv}^{1.25}=$ constant. Determine: <br> (i) Change in enthalpy and change in internal energy <br> (ii) Change in entropy and Heat transfer <br> (iii) Work transfer. $(6+5+2)$ | L3 | Apply |
| 16. | i) Two Carnot engines work in series between the sources and sink temperatures of 550 K and 350 K . If both engines develop equal power determine the intermediate temperature. (6) <br> ii) The specific heats of a gas vary linearly with absolute temperature according to the following relations: $\mathrm{Cp}=(0.85+0.00025 \mathrm{~T}) \mathrm{kJ} / \mathrm{kg} \mathrm{~K}, \text { and }$ $\mathrm{Cv}=(0.56+0.00025 \mathrm{~T}) \mathrm{kJ} / \mathrm{kg} \mathrm{~K}$ <br> If the entropy of the gas at 1 bar pressure and 273 K is zero, find the entropy of the gas at 25 bar and 750 K temperature. (7) | L3 | Apply |
| 17. | A system has a capacity at constant volume $\mathrm{Cv}=\mathrm{AT}^{2}$ where $\mathrm{A}=$ | L3 | Apply |

|  | $0.042 \mathrm{~J} / \mathrm{K}^{3}$. The system is originally at 200 K and a thermal reservoir at 100 K is available. What is the maximum amount of work that can be recovered as the system is cooled down to the temperature of the reservoir? |  |  |
| :---: | :---: | :---: | :---: |
| 18. | A fish freezing plant requires 50 tons of refrigeration. The freezing temperature is $-10^{\circ} \mathrm{C}$ while the temperature is $35^{\circ} \mathrm{C}$. If the performance of the plant is $15 \%$ of the theoretical reversed Carnot cycle working within the same temperature limits, calculate the power required. Take 1 ton $=210 \mathrm{~kJ} / \mathrm{min}$. (13) | L3 | Apply |
| 19. | A rigid cylinder containing $0.006 \mathrm{~m}^{3}$ of nitrogen (molecular weight 28) at 1.04 bar, $15^{\circ} \mathrm{C}$ is heated reversibly until the temperature is $90^{\circ} \mathrm{C}$. Calculate the change of entropy and the heat supplied. Sketch the process on the T-S diagram. Take the isentropic index, $\gamma$, for nitrogen as 1.4, and assume that nitrogen is a perfect gas. (13) | L3 | Apply |
| PART - C |  |  |  |
| 1. | A reversible heat engine in a satellite operates between a hot reservoir at $\mathrm{T}_{1}$, and a radiating panel at $\mathrm{T}_{2}$. Radiation from the panel is proportional to its area and $\mathrm{T}_{2}{ }^{4}$. <br> i) For a given work output and value of T , show that the area of the panel $\mathrm{T}_{2} / \mathrm{T}_{1}=0.75$. T will be minimum when <br> ii) Determine the minimum' area of the panel for an output of 1 kW if the constant of proportionality is $5.67 \times 10^{-8} \mathrm{~W} / \mathrm{m}^{2}-\mathrm{K}^{4}$ and $\mathrm{T}_{1}$, is 1000 K. (10+5) | L3 | Apply |
| 2. | Consider a compressor with air at 1 bar and $15^{\circ} \mathrm{C}$ compressing (a) isothermally to 27.59 bar , and (b) polytropically, the index being 1.3 to the same pressure. Compare the work done, heat exchange with the surroundings, the final temperature and the change in internal energy and entropy due to the compression per unit mass of air. | L3 | Apply |
| 3. | (i) Air expands through a turbine from $500 \mathrm{kPa}, 520^{\circ} \mathrm{C}$ to 100 kPa , $300^{\circ} \mathrm{C}$. During expansion $10 \mathrm{~kJ} / \mathrm{kg}-\mathrm{K}$ of heat is lost to the surroundings which is at $98 \mathrm{kPa}, 20^{\circ} \mathrm{C}$. Neglecting the K.E and P.E changes, determine per kg of air <br> (1) the decrease in availability, <br> (2) the maximum work and <br> (3) the irreversibility. (8) <br> (ii) Air enters a compressor operating at steady state at a pressure of 1 bar , a temperature of 290 K and a velocity of $6 \mathrm{~m} / \mathrm{s}$ through an inlet with an area of $0.1 \mathrm{~m}^{2}$. At the exit, the pressure is 8 bar , the temperature is 450 K and the velocity is $2 \mathrm{~m} / \mathrm{s}$. Heat transfer from the compressor to the surroundings occurs at the rate of $180 \mathrm{~kJ} / \mathrm{min}$. Employing the ideal gas model, calculate the power input to the compressor. (7) | L3 | Apply |
| 4. | A reversible heat engine operates between two reservoirs at temperatures of $600^{\circ} \mathrm{C}$ and $40^{\circ} \mathrm{C}$. The engine drives a reversible refrigerator which operates between reservoirs at temperatures of $40^{\circ} \mathrm{C}$ and $-20^{\circ} \mathrm{C}$. The heat transfer to the heat engine is 2000 kJ and the network output for the combined engine v refrigerator is 360 kJ . (i) Calculate the heat transfer to the refrigerant and the net heat transfer to the reservoir at $40^{\circ} \mathrm{C}$. (ii) Reconsider (i) given that the efficiency of the heat engine and the C.O.P. of the refrigerator are | L3 | Apply |

|  | each 40 per cent of their maximum possible values. |  |  |

| 24. | What is the difference between spark-ignition and compressionignition engines? | L2 | Understanding |
| 25. | Define Regeneration? | L1 | Remembering |
| 26. | Define Reheat? | L1 | Remembering |
| 27. | Define Intercooling? | L1 | Remembering |
| PART - B |  |  |  |
| 1. | (i) An ideal Otto cycle has compression ratio of 8 . At the beginning of the compression process, air is at 100 kPa and $17^{\circ} \mathrm{C}$, and 800 | L3 | Apply |

|  | $\mathrm{kJ} / \mathrm{kg}$ of heat is transferred to air the constant volume heat addition process. Assuming cold air standard assumption, determine <br> (1) the maximum pressure and temperature that occur during the cycle, <br> (2) the net work done, <br> (3) thermal efficiency and <br> (4) mean effective pressure for the cycle. (8) <br> ii) Show that the thermal efficiency of Brayton cycle depends only on <br> the pressure ratio. Also draw its P-v and T-s diagram. (5) |  |  |
| :---: | :---: | :---: | :---: |
| 2. | With a neat $\mathrm{P}-\mathrm{v}$ and $\mathrm{T}-\mathrm{s}$ diagram, explain the various processes involved in Dual cycle and also derive an expression for the efficiency of dual cycles. (13) | L2 | Understanding |
| 3. | An ideal Diesel cycle with air as the working fluid has a compression ratio of 18 and a cut-off ratio of 2 . At the beginning of compression process, the working fluid is at $100 \mathrm{KPa}, 27^{\circ} \mathrm{C}$ and $1917 \mathrm{~cm}^{3}$. Determine: <br> a) the temperature and pressure of air at the end of each process <br> b) network output <br> c) thermal efficiency and <br> d) the mean effective pressure. | L3 | Apply |
| 4. | An air standard dual cycle has a compression ratio of 16 and compression begins at $1 \mathrm{bar}, 50^{\circ} \mathrm{C}$. The maximum pressure is 70 bar. The heat transferred to air at constant pressure is equal to that at constant volume. Estimate: <br> a) the pressures and temperatures at the cardinal points of the cycle, <br> b) the cycle efficiency and <br> c) the MEP of the cycle. Take $\mathrm{Cv}=0.718 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ and $\mathrm{Cp}=1.005$ KJ/kg K. | L3 | Apply |
| 5. | An I.C. engine operating on the dual cycle (limited pressure cycle) the temperature of the working fluid (air) at the beginning of compression is $27^{\circ} \mathrm{C}$. The ratio of the maximum and minimum pressures of the cycle is 70 and the compression ratio is 15 . The amounts of heat added at constant volume and at constant pressure are equal. Compute the air standard thermal efficiency of the cycle. Take $7=1.4$ for air. (13) | L3 | Apply |
| 6. | Air enters the compressor of a gas turbine plant operating on Brayton cycle at $101.325 \mathrm{kPa}, 27^{\circ} \mathrm{C}$. The pressure ratio in the cycle is 6 . Calculate the maximum temperature in the cycle and the cycle efficiency. Assume $\mathrm{W}_{\mathrm{T}}=2.5 \mathrm{~W}_{\mathrm{C}}$ where $\mathrm{W}_{\mathrm{T}}$ and $\mathrm{W}_{\mathrm{C}}$ are the turbine and the compressor work respectively. Take $\gamma=1.4$. | L3 | Apply |
| 7. | Derive the expression for irreversibility or energy loss in a process executed by (i) a closed system and (ii) a steady flow system, in a given environment. | L2 | Understanding |
| 8. | What is an Otto cycle? Show that the efficiency of the Otto cycle depends only on the compression ratio. (7) <br> (ii) Derive an expression of optimum pressure ratio for maximum network output in an ideal corresponding cycle efficiency? | L2 | Understanding |
| 9. | (i) A diesel engine has air before compression at $280 \mathrm{~K}, 85 \mathrm{kPa}$. The highest temperature and highest pressure is 2200 K and 6 MPa respectively. Find the volumetric compression ratio and the mean | L3 | Apply |

|  | effective pressure using cold air properties at 300 K .(8) <br> (ii) An air-standard Ericsson cycle has an ideal regenerator. Heat is supplied at $1000^{\circ} \mathrm{C}$ and heat is rejected at $80^{\circ} \mathrm{C}$. Pressure at the beginning of the isothermal compression process is 70 kPa . The heat added is $700 \mathrm{~kJ} / \mathrm{kg}$. Find the compressor work, the turbine work, and the cycle efficiency. |  |  |
| :---: | :---: | :---: | :---: |
| 10. | (i) A gas-turbine power plant operating on an ideal Brayton cycle has a pressure ratio of 8 . The gas temperature is 300 K at the compressor inlet and 1300 K at the turbine inlet. Utilizing the airstandard assumptions, determine <br> (1) the gas temperature at the exits of the compressor and the turbine <br> (2) the back work ratio, and <br> (3) the thermal efficiency. | L3 | Apply |
| 11. | Calculate the decrease in available energy when 25 kg of water at $95^{\circ} \mathrm{C}$ mix with 35 kg of water at $35^{\circ} \mathrm{C}$, the pressure being taken as constant and the temperature of the surroundings being $15^{\circ} \mathrm{C} \mathrm{Cp}$ of water is $4.8 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$. | L3 | Apply |
| 12. | (i) Show that the efficiency of the Brayton cycle depends only on the pressure ratio. (7) <br> (ii) What is a compression ignition engine? Why is the compression ratio of such an engine more than that of an SI engine? (6) | L2 | Understanding |
| 13. | Two kg of air at $500 \mathrm{kPa}, 80^{\circ} \mathrm{C}$ expands adiabatically in a closed system until its volume is doubled and its temperature becomes equal to that of the surroundings which is at $100 \mathrm{kPa}, 50^{\circ} \mathrm{C}$. For this process, determine: <br> i) the maximum work, (4) <br> ii) the change in availability, and (4) <br> iii) the irreversibility. (5) | L3 | Apply |
| 14. | The compression ratio for a single-cylinder engine operating on dual cycle is 9 . The maximum pressure in the cylinder is limited to 60 bar. The pressure and temperature of the air at the beginning of the cycle are 1 bar and $30^{\circ} \mathrm{C}$. Heat is added during constant pressure process upto 4 percent of the stroke. Assuming the cylinder diameter and stroke length as 250 mm and 300 mm respectively, determine : <br> i) The air standard efficiency of the cycle <br> ii) The power developed if the number of working cycles is 3 per second. Take for air $\mathrm{Cv}=0.71 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ and $\mathrm{Cp}=1.0 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$. | L3 | Apply |
| 15. | An ideal cycle using air as the working fluid has a compression ratio of 18 and cut off ratio of 3 . The intake conditions are $150 \mathrm{Kpa}, 25^{\circ} \mathrm{C}$ and $2500 \mathrm{~cm}^{3}$. Determine: <br> (i) The net work output. (6) <br> (ii) Thermal efficiency of cycle. (6) <br> (iii) The mean effective pressure. (4) | L3 | Apply |
| 16. | An engine working on the Otto cycle is supplied with air at 0.1 Mpa , $35^{\circ} \mathrm{C}$. The compression ratio is 10 . Heat supplied is $2400 \mathrm{~kJ} / \mathrm{kg}$. Calculate the maximum pressure and temperature of the cycle, the cycle efficiency and the mean effective pressure. (Take for air $\mathrm{Cp}=1,005 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$, $\mathrm{Cv}=0.718 \mathrm{~kJ} / \mathrm{kg}$ and $\mathrm{R}=0.287 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ ). | L3 | Apply |
| 17. | 1 kg of ice at $0^{\circ} \mathrm{C}$ is mixed with 10 kg of water at $30^{\circ} \mathrm{C}$. Determine the net increase in the entropy and unavailable energy when the | L3 | Apply |

|  | system reaches common temperature. Assume that surrounding temperature is $10^{\circ} \mathrm{C}$. Take, specific heat of water $4.18 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ specific heat of ice $=2.1 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$; latent heat of ice $333.5 \mathrm{~kJ} / \mathrm{kg}$. (13) |  |  |
| :---: | :---: | :---: | :---: |
| 18. | An air-standard Diesel cycle has a compression ratio of 18, and the heat transferred to the working fluid per cycle is $1800 \mathrm{~kJ} / \mathrm{kg}$. At the beginning of the compression stroke, the pressure is I bar and the temperature is 300 K . Calculate: (i) Thermal efficiency, (ii) The mean effective pressure. | L3 | Apply |
| 19. | 36 g of air in a piston-cylinder assembly undergo a Stirling cycle with a compression ratio of 6 . At the beginning of the isothermal compression, the pressure and volume are 1 bar and $0.03 \mathrm{~m}^{3}$, respectively. The temperature during the isothermal expansion is 1000 K. Assuming the ideal gas model and ignoring kinetic and potential energy effects, determine <br> (a) The net work, in kJ . <br> (b) The thermal efficiency. <br> (c) The mean effective pressure, in bar | L3 | Apply |
| 20. | An air standard Ericsson cycle has an ideal regenerator. Heat is supplied at $1000^{\circ} \mathrm{C}$ and heat is rejected at $80^{\circ} \mathrm{C}$. Pressure at the beginning of the isothermal compression process is 70 kPa . The heat added is $700 \mathrm{~kJ} / \mathrm{kg}$. Find the compression work, the turbine work, back work ratio and the cycle efficiency. | L3 | Apply |
| PART - C |  |  |  |
| 1. | With your understanding, analyse why piston engine is not able to replace jet engines used in large and high-speed aircrafts. (15) | L2 | Understanding |
| 2. | At the beginning of the compression process of an air-standard dual cycle with a compression ratio of 18 , the temperature is 300 K and the pressure is 0.1 MPa . The pressure ratio for the constant volume part of the heating process is $1.5: 1$. The volume ratio for the constant pressure part of the heating process is 1.2:1. Determine : <br> (i) the thermal efficiency and <br> (ii) the mean effective pressure, in MPa. | L3 | Apply |
| 3. | In an engine working on Dual cycle, the temperature and pressure at the beginning of the cycle are $90^{\circ} \mathrm{C}$ and 1 bar respectively. The compression ratio is 9 . The maximum pressure is limited to 68 bar and total heat supplied per kg of air is 1750 kJ . Determine: <br> (i) Pressure and temperatures at all salient points <br> (ii) Air standard efficiency <br> (iii) Mean effective pressure | L3 | Apply |
| 4. | Air enters the compressor of a cold air-standard Brayton cycle with regeneration, intercooling, and reheat at $100 \mathrm{kPa}, 300 \mathrm{~K}$, with a mass flow rate of $6 \mathrm{~kg} / \mathrm{s}$. The compressor pressure ratio is 10 , and the pressure ratios are the same across each compressor stage. The intercooler and reheater both operate at the same pressure. The temperature at the inlet to the second compressor stage is 300 K , and the inlet temperature for each turbine stage is 1400 K . The compressor and turbine stages each have isentropic efficiencies of $80 \%$ and the regenerator effectiveness is $80 \%$. For $\gamma=1.4$, calculate <br> (a) The thermal efficiency of the cycle. <br> (b) The back work ratio. | L3 | Apply |

| (c) The net power developed, in kW . |  |  |  |
| :---: | :---: | :---: | :---: |

| PART - B |  |  |  |
| 1. | (i) A pressure cooker contains 1.5 kg of saturated steam at 5 bar. Find the quantity of heat which must be rejected so as to reduce the quality to $60 \%$ dry. Determine the pressure and temperature of the steam at the new state, the amount of total heat transferred. (7) <br> (ii) Explain in detail about the formation of superheated steam from $20^{\circ} \mathrm{C}$ of ice with T-v diagram. Also explain the various processes involved in it. (6) | L3 | Apply |
| 2. | Consider a steam power plant operating on the ideal Rankine cycle. Steam enters the turbine at 3 MPa and $350^{\circ} \mathrm{C}$ and is condensed in the condenser at a pressure of 10 kPa . Determine <br> (i) the thermal efficiency of this power plant, <br> (ii) the thermal efficiency if steam is superheated to $600^{\circ} \mathrm{C}$ instead of $350^{\circ} \mathrm{C}$ and <br> (iii) the thermal efficiency if the boiler pressure is raised to 15 MPa | L3 | Apply |

|  | while the turbine inlet temperature is maintained at $600^{\circ} \mathrm{C}$. (13) |  |  |
| :---: | :---: | :---: | :---: |
| 3. | What is meant by property diagram? With neat sketches, explain the six different types of commonly encountered property diagrams in brief. (13) | L2 | Understanding |
| 4. | Steam is the working fluid in an ideal Rankine cycle. Saturated vapor enters the turbine at 8.0 MPa and saturated liquid exits the condenser at a pressure of 0.008 MPa . The net power output of the cycle is 100 MW. Determine for the cycle: <br> a) the thermal efficiency <br> b) the back work ratio <br> c) the mass flow rate of the steam, in $\mathrm{kg} / \mathrm{h}$ <br> d) the rate of heat transfer, Qin, into the working fluid as it passes through the boiler, in MW <br> e) the rate of heat transfer Qout, from the condensing steam as it passes through the condenser, in MW, if cooling water enters the condenser at $15^{\circ} \mathrm{C}$ and exits at $35^{\circ} \mathrm{C}$. (13) | L3 | Apply |
| 5. | An insulated piston-cylinder device contains 5 litres of saturated liquid water at a constant pressure of 150 KPa . An electric resistance heater inside by the cylinder is now turned on and 2200 kJ of energy is transferred to the steam. Determine the entropy change of the water during this process. (10) | L3 | Apply |
| 6. | A simple Rankine cycle works between pressures 28 bar and 0.06 bar, the initial condition of steam being dry saturated. Calculate the cycle efficiency, work ratio and specific steam consumption. (13) | L3 | Apply |
| 7. | Steam is initially at $1.5 \mathrm{MPa}, 300^{\circ} \mathrm{C}$ expands reversibly and adiabatically in a steam turbine to $40^{\circ} \mathrm{C}$. Determine the ideal work output of the turbine per kg of steam. Sketch the process in T-s and h s diagrams. (13) | L3 | Apply |
| 8. | A rigid tank of volume $0.5 \mathrm{~m}^{3}$ contains 80 percent by volume of saturated liquid water and 20 percent by volume of saturated steam at $200^{\circ} \mathrm{C}$. Now 140 kg of liquid water is pumped into the tank. If the final temperature of the fluid in the tank is $80^{\circ} \mathrm{C}$, determine the final pressure. | L3 | Apply |
| 9. | A rigid tank of 0.03 m 3 volume contains a mixture of liquid water and water vapor at 80 kPa . The mass of the mixture in the tank is 12 kg . Calculate the heat added and quality of the mixture when the pressure inside the tank is raised to 7 MPa . | L3 | Apply |
| 10. | Draw the phase equilibrium diagram for a pure substance on P-T coordinate. Justify the fusion on line for water have negative slope. | L2 | Understanding |
| 11. | A steam power plant works between 40 bar and 0.05 bar. If the steam supplied is dry saturated and cycle of operation is Rankine, determine Cycle efficiency and specific steam consumption. | L3 | Apply |
| 12. | An unknown quantity of super-heated steam is throttled from 10 bar and $200^{\circ} \mathrm{C}$ to 8 bar. Sketch the process on a T-v diagram. Calculate the following: (i) Final state of steam (1) Change in specific volume (iii) Increase in specific entropy. Given the specific heat at constant pressure of steam as $2.1 \mathrm{~kJ} / \mathrm{kgK}$. | L3 | Apply |
| 13. | Explain the P-v-T surface diagram for substances that expand on freezing with a neat labelled sketch. | L2 | Understanding |
| 14. | Draw the phase equilibrium diagram for a pure substance on p-T coordinates. Why does the fusion line for water have negative slope? | L2 | Understanding |

|  | (ii) What is quality of steam? What are the different methods of measurement of quality? Explain any one method. (7+6) |  |  |
| :---: | :---: | :---: | :---: |
| 15. | (i) Describe a simple ideal Rankine cycle with a schematic diagram. Explain the processes involved by T-s diagram. (6) <br> (ii) A Steam power plant operates between a boiler pressure of 4 MPa and $300^{\circ} \mathrm{C}$ and a condenser pressure of 50 kPa . Determine the thermal efficiency of the cycle assuming the cycle to be a simple ideal Rankine cycle. | L3 | Apply |
| 16. | A closed, rigid container of volume $0.5 \mathrm{~m}^{3}$ is placed on a hot plate. Initially the container holds a two-phase mixture of saturated liquid water and saturated water vapor at $\mathrm{P}_{1}=1$ bar with a quality of 0.5 . After heating, the pressure in the container is $\mathrm{P}_{2}=1.5$ bar. Indicate the initial and final states on a T-v diagram, and determine: <br> (i) the temperature, in ${ }^{\circ} \mathrm{C}$, at each state. <br> (ii) the mass of vapor present at each state, in kg . <br> (i) if heating continues, determine the pressure, in bar, when the container holds only saturated vapor. | L3 | Apply |
| 17. | Steam is the working fluid in an ideal Rankine cycle with superheat and reheat. Steam enters the first-stage turbine at $8.0 \mathrm{MPa}, 480^{\circ} \mathrm{C}$, and expands to 0.7 MPa . It is then reheated to $440^{\circ} \mathrm{C}$ before entering the second-stage turbine, where it expands to the condenser pressure of 0.008 MPa . The net power output is 100 MW . Determine : <br> (i) the thermal efficiency of the cycle <br> (ii) the mass flow rate of steam, in $\mathrm{kg} / \mathrm{h}$ <br> (iii) the rate of heat transfer Qout from the condensing steam as it passes through the condenser, in MW. Discuss the effects of reheat on the vapor power cycle. | L3 | Apply |
| 18. | Steam at 7 bar and dryness fraction 0.95 expands in a cylinder behind a piston isothermally and reversibly to a pressure of 1.5 bar. The heat supplied during the process is found to be $420 \mathrm{~kJ} / \mathrm{kg}$. Calculate per kg <br> (i) The change of internal energy <br> (ii) The change of enthalpy <br> (iii) The work done. $(5+5+3)$ | L3 | Apply |
| 19. | A simple Rankine cycle works between pressures 28 bar and 0.06 bar, the initial condition of steam being dry saturated. Calculate the cycle efficiency, work ratio and specific steam consumption. | L3 | Apply |
| 20. | A vessel of volume 0.04 m 3 contains a mixture of saturated water and saturated steam at a temperature of $250^{\circ} \mathrm{C}$. The mass of the liquid present is 9 kg . Find the pressure, the mass, the specific volume, the enthalpy, the entropy and the internal energy. | L3 | Apply |
| 21. | A steam power station uses the following cycle : <br> Steam at boiler outlet -150 bar, $550^{\circ} \mathrm{C}$ <br> Reheat at 40 bar to $550^{\circ} \mathrm{C}$ <br> Condenser at 0.1 bar. <br> Using the Mollier chart and assuming ideal processes, find the <br> i) quality at turbine exhaust, (4) <br> ii) cycle efficiency, and (4) <br> iii) steam rate. (5) | L3 | Apply |
| 22. | A heat pump working on an ideal vapour-compression cycle using Freon-12 as the working fluid is used to heat a room. The condenser | L3 | Apply |

|  | and evaporator pressures are 1.6 and 0.32 Mpa , respectively. The heat transfer required for the condenser unit is $100 \mathrm{MJ} / \mathrm{h}$. The Freon- 12 is saturated at the beginning of compression and is at $55^{\circ} \mathrm{C}$ at the end of compression. Determine <br> (i) the mass flow rate of the refrigerant, <br> (ii) the quality of Freon-12 at the entry to the evaporator, and <br> (iii) the power input to the compressor. |  |  |
| :---: | :---: | :---: | :---: |
| 23. | (i) What are the desirable properties of refrigerants? (4) <br> (ii) Describe a Heat pump cycle with a reversing valve with a neat sketch. (6) <br> (iii) An absorption refrigeration system receives heat from a source at $130^{\circ} \mathrm{C}$ and maintains the refrigerated space at $-18^{\circ} \mathrm{C}$. If the environment temperature is $30^{\circ} \mathrm{C}$, determine the maximum possible COP for this system. (6) | L3 | Apply |
| 24. | (i) A pressure cooker contains 1.5 kg of steam at 5 bar and 0.9 dryness when the gas was switched off. Determine the quantity of heat rejected by the 'pressure cooker when the pressure in the cooker falls to 1 bar. (7) <br> (ii) Steam at 19 bar is throttled to 1 bar and the temperature after throttling is found to be $150^{\circ} \mathrm{C}$. Calculate the initial dryness fraction of the steam. | L3 | Apply |
| 25. | In a regenerative cycle the inlet conditions are 40 bar and $400^{\circ} \mathrm{C}$. Steam is bled at 10 bar in regenerative heating. The exit pressure is 0.8 bar. Neglecting pump work. Determine the efficiency of the cycle. | L3 | Apply |
| PART - C |  |  |  |
| 1. | Consider a steam power plant that operates on ideal reheat Rankine cycle. The plant maintains the boiler at 7000 KPa , the reheat section at 800 KPa and the condenser at 10 KPa . The mixture quality at the exit of both turbines is $93 \%$. Determine the temperature at the inlet of high pressure and low-pressure turbine respectively. | L3 | Apply |
| 2. | In a Rankine cycle, steam enters the first stage turbine at 10 MPa and $500^{\circ} \mathrm{C}$, expands to 0.1 MPa . It is then reheated to $450^{\circ} \mathrm{C}$ before expansion in the LP turbine. It then expands to a condenser pressure of 0.01 MPa . Net power developed is 100 MW . Both the turbines have an efficiency of $80 \%$. Calculate (i) Overall thermal efficiency of the cycle (ii) mass flow rate of steam. | L3 | Apply |
| 3. | (i) Determine whether water at each of the following states is a compressed liquid, a superheated vapor, or a mixture of saturated liquid and vapor. (8) <br> (1) $\mathrm{P}=10 \mathrm{MPa}, v=0.003 \mathrm{~m}^{3} / \mathrm{kg}$ <br> (2) $1 \mathrm{MPa}, 190^{\circ} \mathrm{C}$ <br> (3) $200^{\circ} \mathrm{C}, 0.1 \mathrm{~m}^{3} / \mathrm{kg}$ <br> (4) $10 \mathrm{kPa}, 10^{\circ} \mathrm{C}$ <br> (ii) A steam turbine has an inlet of $2 \mathrm{~kg} / \mathrm{s}$ water at $1000 \mathrm{kPa}, 350^{\circ} \mathrm{C}$ and velocity of $15 \mathrm{~m} / \mathrm{s}$. The exit is at $100 \mathrm{kPa}, 150^{\circ} \mathrm{C}$ and very low velocity. Find the specific work and the power produced. | L3 | Apply |

| 1. | With neat sketches, explain in brief about the various classifications of jet engines. (13) | L2 | Understanding |
| 2. | A turbojet aircraft flies at sea level at a Mach number of 1.5 at an altitude where ambient pressure and ambient temperature are 11.6 kPa and 205 K respectively. Mass flow rate is $50 \mathrm{~kg} / \mathrm{s}$, compressor pressure ratio is 1.2 , temperature in combustion chamber is 1400 K . Assume the turbojet operates on ideal Brayton cycle. Take calorific value of fuel used as $45 \mathrm{MJ} / \mathrm{kg}, \mathrm{Y}=1.4 \mathrm{Cp}=1 \mathrm{~kJ} / \mathrm{kg}-\mathrm{K}$. Calculate the thrust developed by the engine by assuming the nozzle exit | L3 | Apply |

|  | pressure is equal to the ambient pressure. (13) |  |  |
| :---: | :---: | :---: | :---: |
| 3. | Air enters a compressor operating at steady state at a pressure of 1 bar, a temperature of 290 K and a velocity of $6 \mathrm{~m} / \mathrm{s}$ through an inlet with an area of 0.1 m 2 . At the exit, the pressure is 8 bar , the temperature is 450 K and the velocity is $2 \mathrm{~m} / \mathrm{s}$. Heat transfer from the compressor to the surroundings occurs at the rate of $180 \mathrm{~kJ} / \mathrm{min}$. Employing the ideal gas model, calculate the power input to the compressor. (7) | L3 | Apply |
| 4. | What are the various classification of jet engines? Explain them with neat sketches. | L2 | Understanding |
| 5. | i) A slab 0.2 m thick with thermal conductivity of $45 \mathrm{~W} / \mathrm{mK}$ receives heat from a furnace at 500 K both by convection and radiation. The convection coefficient has a value of $50 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. The surface temperature is 400 K on this side. The heat is transferred to surroundings at $\mathrm{T}_{\infty}$ both by convection and radiation. The convection coefficient on this side being $60 \mathrm{~W} / \mathrm{m} 2 \mathrm{~K}$. Determine the surrounding temperature. Consider $1 \mathrm{~m}^{2}$ area and shape factor as 1 for radiation. (7) <br> ii) A solid sphere of 0.09 m radius generates heat at $5 \times 10^{6} \mathrm{~W} / \mathrm{m}^{3}$. The conductivity of the material is $30 \mathrm{~W} / \mathrm{m}-\mathrm{K}$. The heat generated is convected over the outer surface to a fluid at $160^{\circ} \mathrm{C}$, with a convective heat transfer coefficient of $750 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. Determine the maximum temperature in the material and the temperature at radius $=0.06 \mathrm{~m}$. (6) | L3 | Apply |
| 6. | A reactor's wall 320 mm thick is made tip of an inner layer of firebrick $\left(\mathrm{k}=0.84 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}\right)$ covered with a layer of insulation $(\mathrm{k}=$ $0.16 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ ). The reactor operates at a temperature of $1325^{\circ} \mathrm{C}$ and the ambient temperature is $25^{\circ} \mathrm{C}$. (i) Determine the thickness of firebrick and insulation which gives minimum heat loss, and (ii) Calculate the heat loss presuming that the insulating material has a maximum temperature of $1200^{\circ} \mathrm{C}$. (13) | L3 | Apply |
| 7. | An aircraft flies at a speed of 520 kmph at an altitude of 8000 m . The diameter of the propeller of an aircraft is 2.4 m and flight to jet speed ratio is 0.74 . Find the following: <br> (i) The rate of air flow through the propeller <br> (ii) Thrust produced <br> (iii) Specific thrust <br> (iv) Specific impulse <br> (v) Thrust power. | L3 | Apply |
| 8. | Explain with a neat sketch of turbojet engine and with neat P-V and T-S diagram the working principle and also obtain an expression for thrust equation. (13) | L2 | Understanding |
| 9. | A composite plane wall of materials $A$ and $B$ have a thickness of $L_{A}$ $=50 \mathrm{~mm}$ and $\mathrm{L}_{\mathrm{B}}=25 \mathrm{~mm}$. The thermal conductivity of materials are $\mathrm{K}_{\mathrm{A}}=70 \mathrm{~W} / \mathrm{m}-\mathrm{K}$ and $\mathrm{K}_{\mathrm{B}}=100 \mathrm{~W} / \mathrm{m}-\mathrm{K}$ The outer surface of the wall A is perfectly insulated and the inside it, the heat is generated at an uniform rate of $2000 \mathrm{~kW} / \mathrm{m}^{3}$. The outer surface of the wall B is cooled by water at $20^{\circ} \mathrm{C}$ and $\mathrm{h}=1 \mathrm{~kW} / \mathrm{m}^{2} \mathrm{~K}$. Determine the temperate at the insulated and cooled surfaces. | L3 | Apply |
| 10. | State Planck's laws of radiation and prove that the value of StefanBoltzmann constant is $5.67 \times 10^{8} \mathrm{~W} / \mathrm{m}^{2}-\mathrm{K}^{4}$. | L2 | Understanding |

| 11. | Derive an expression for the overall heat transfer coefficient between two fluids at different temperatures $\mathrm{T}_{1} \mathrm{~K}$ and $\mathrm{T}_{2} \mathrm{~K}$ respectively, separated by a plain wall of thermal conductivity ' K '. Assume that the convective heat transfer coefficient between the inner fluid and wall surface is ' h ' and that between the outer fluid and wall surface is ' $h_{2}$ ' respectively. | L3 | Apply |
| :---: | :---: | :---: | :---: |
| 12. | Consider a composite wall that includes an 8 mm thick Oakwood siding ( $K=0.36 \mathrm{~W} / \mathrm{mK}$ ). Glass fiber insulation $(\mathrm{K}=0.062 \mathrm{~W} / \mathrm{mK})$ and a 12 mm layer of vermiculite wall board $(\mathrm{K}=0.056 \mathrm{~W} / \mathrm{mK})$. The layers are held together by 20 mm diameter and 40 mm long $0.5 \%$ carbon steel studs ( $\mathrm{K}=40 \mathrm{~W} / \mathrm{mK}$ ) with 1 stud for every $1.5 \mathrm{~m}^{2}$ area of the wall. What is the effective thermal resistance associated with a wall that is 2 m high by 3 m wide? Assume surfaces normal to the x direction are isothermal. If the wall insulates a storehouse with inside temperature $40^{\circ} \mathrm{C}$ and outside temperature $15^{\circ} \mathrm{C}$, find out the heat transfer across the wall | L3 | Apply |
| 13. | Derive an expression for overall heat transfer coefficient $U$, for a composite wall made up of number of layers. | L2 | Understanding |
| 14. | A spherical ball of 10 cm diameter maintained at a constant temperature of 1100 K is suspended in air. Assuming the ball to closely approximate a blackbody, determine (i) the total blackbody emissive power, (ii) the total amount of radiation emitted by the ball in 10 minutes, and (iii) the spectral blackbody emissive power at a wavelength of $3 \mu \mathrm{~m}$. | L3 | Apply |
| 15. | Derive an expression for the net thrust produced by an aircraft gas turbine engine. | L2 | Understanding |
| 16. | (i) A plane wall is 150 mm thick and its wall area is $4.5 \mathrm{~m}^{2}$. If its conductivity is $9.35 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ and surface temperatures are steady at $150^{\circ} \mathrm{C}$ and $45^{\circ} \mathrm{C}$ determine: <br> (1) heat flow across the plane wall; <br> (2) temperature gradient in the flow direction. (8) <br> (ii) A surface at $250^{\circ} \mathrm{C}$ exposed to the surroundings at $110^{\circ} \mathrm{C}$ convects and radiates heat to the surroundings. The convective coefficient and radiation factor are $75 \mathrm{~W} / \mathrm{m}^{2{ }^{2}} \mathrm{C}$ and unity respectively. If the heat is conducted to the surface through a solid of conductivity $10 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$, what is the temperature gradient at the surface in the solid? | L3 | Apply |
| 17. | How does the thermodynamics differ from heat transfer? Explain the different modes of heat transfer with suitable examples. And discuss how does the heat conduction takes place in solid, liquid and gas phases. | L2 | Understanding |
| 18. | Explain in detail about the different modes of heat transfer. | L2 | Understanding |
| 19. | Draw the real and ideal, T-Sand P-V diagram for a gas turbine engine. Derive expression for the isentropic efficiency for compressor. | L2 | Understanding |
| 20. | An aircraft flies at $90 \mathrm{~km} / \mathrm{hr}$. One of its turbojet engines takes in 40 $\mathrm{kg} / \mathrm{s}$ of air and expands the gases to the ambient pressure. The airfuel ratio is 50 and the lower calorific value of the fuel is $43 \mathrm{MJ} / \mathrm{kg}$. For maximum thrust power, determine: jet velocity, thrust, specific | L3 | Apply |

|  | thrust, thrust power, propulsive and thermal efficiencies. (13) |  |  |
| :---: | :---: | :---: | :---: |
| 21. | A cold storage room has walls made of 0.23 m of brick on the outside, 0.08 m of plastic foam, and finally 15 mm of wood on the inside. The outside and inside air temperatures are $22^{\circ} \mathrm{C}$ and $-2^{\circ} \mathrm{C}$ respectively. If the inside and outside heat transfer co-efficients are respectively 29 and $12 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$ and the thermal conductivities of brick, foam and wood are $0.98,0.02$ and $0.17 \mathrm{~W} / \mathrm{mK}$ respectively determine (i) the rate of heat removal by refrigeration if the total wall area is 90 m , and (ii) the temperature of the inside surface of the brick. | L3 | Apply |
| PART - C |  |  |  |
| 1. | Air at a temperature of $20^{\circ} \mathrm{C}$ passes through a heat exchanger at a velocity of $40 \mathrm{~m} / \mathrm{s}$ where its temperature is raised to $820^{\circ} \mathrm{C}$. It then enters a turbine with the same velocity of $40 \mathrm{~m} / \mathrm{s}$ and expands until the temperature falls to $620^{\circ} \mathrm{C}$. On leaving the turbine, the air is taken at a velocity of $55 \mathrm{~m} / \mathrm{s}$ to a nozzle where it expands until the temperature has fallen to $10^{\circ} \mathrm{C}$. If the air flow rate is $2.5 \mathrm{~kg} / \mathrm{s}$. calculate <br> (i) The rate of heat transfer to the air in the heat exchanger, <br> (ii) The power output from the turbine assuming no heat loss. <br> (iii) The velocity at the exit from the nozzle, assuming no heat loss. Take the enthalpy of air as $\mathrm{h}=\mathrm{CpT}$, where Cp is the specific heat equal to $1.005 \mathrm{~kJ} / \mathrm{kg}^{\circ} \mathrm{C}$ and T the temperature." | L3 | Apply |
| 2. | With your understanding, analyse why piston engine is not able to replace jet engines used in large and high-speed aircrafts. (15) | L2 | Understanding |
| 3. | A room is maintained at $27^{\circ} \mathrm{C}$ while the surroundings are at $2^{\circ} \mathrm{C}$. the temperature of the inner and outer surfaces of the wall ( $\mathrm{k}=0.71$ $\mathrm{W} / \mathrm{mK}$ ) are measured to be $21^{\circ} \mathrm{C}$ and $6^{\circ} \mathrm{C}$ respectively. Heat flows steadily through the wall $5 \mathrm{~m} \times 7 \mathrm{~m}$ in cross-section and 0.32 m in thickness. Determine (i) the rate of heat transfer through the wall, (ii) the rate of entropy generation in the wall, and (iii) the rate of total entropy generation with this heat transfer process. | L3 | Apply |
| 4. | A reversible heat engine in a satellite operates between a hot reservoir at $\mathrm{T}_{1}$, and a radiating panel at $\mathrm{T}_{2}$. Radiation from the panel is proportional to its area and $\mathrm{T}_{2}{ }^{4}$. <br> i) For a given work output and value of T, show that the area of the panel $\mathrm{T}_{2} / \mathrm{T}_{1}=0.75$. T will be minimum when <br> ii) Determine the minimum' area of the panel for an output of 1 kW if the constant of proportionality is $5.67 \times 10^{-8} \mathrm{~W} / \mathrm{m}^{2}-\mathrm{K}^{4}$ and $\mathrm{T}_{1}$, is 1000 K. $(10+5)$ | L3 | Apply |
| 5. | A turbojet plane flies with speed of 1000 kmph and inducts air at the rate of $50 \mathrm{~kg} / \mathrm{s}$. Air fuel ratio is 52 and the expansion of gases occurs up to ambient pressure. Lower calorific value of fuel is $43100 \mathrm{~kJ} / \mathrm{kg}$. For maximum thrust the flight to jet velocity ratio is 0.5 . Determine <br> (i) jet velocity, <br> (ii) maximum thrust, <br> (iii) specific thrust. <br> (iv) thrust power, <br> (v) propulsive, thermal and overall efficiencies, <br> (vi) Specific fuel consumption. | L3 | Apply |

| 6. | Explain briefly the history of jet engines and show the working of Ram jet engine using relevant sketches. | L2 | Understanding |
| :---: | :---: | :---: | :---: |
| 7. | A turbojet engine operates between the pressure limits of 35 kPa and 350 kPa . The inlet air temperature is $-40^{\circ} \mathrm{C}$ and the upper temperature limit is 1370 K . Calculate the specific momentum thrust of the engine assuming isentropic compression and expansion and an inlet velocity of $100 \mathrm{~m} / \mathrm{s}$. Also, determine the heat input and the power delivered per unit mass. Take the gas to be equivalent to air and the velocity at the nozzle inlet to be negligible. | L3 | Apply |
| 8. | A gas turbine unit receives air at 1 bar and 300 K and compresses it adiabatically to 6.2 bar. The compressor efficiency is $88 \%$. The fuel has a heating valve of $44186 \mathrm{~kJ} / \mathrm{kg}$ and the fuel-air ratio is 0.017 $\mathrm{kJ} / \mathrm{kg}$ of air. The turbine internal efficiency is $90 \%$. Calculate the work of turbine and compressor per kg of air compressed and thermal efficiency. | L3 | Apply |
| 9. | Boeing 747 aircraft is powered by four CF-6 turbofan engines manufactured by General Electric Company. Each engine has the following data: <br> Thrust force 24.0 kN <br> Air mass flow rate $125 \mathrm{~kg} / \mathrm{s}$ <br> Bypass ratio 5.0 <br> Fuel mass flow rate $0.75 \mathrm{~kg} / \mathrm{s}$ <br> Operating Mach number 0.8 <br> Altitude 10 km <br> Ambient temperature 223.2 K <br> Ambient pressure 26.4 kPa <br> Fuel heating value $42,800 \mathrm{~kJ} / \mathrm{kg}$ <br> If the thrust generated from the fan is $75 \%$ of the total thrust, determine <br> i) The jet velocities of the cold air and hot gases (2) <br> ii) The specific thrust (2) <br> iii) The Thrust Specific Fuel Consumption (TSFC) (2) <br> iv) The propulsive efficiency (3) <br> v) The thermal efficiency (3) <br> vi) The overall efficiency. (3) | L3 | Apply |
| 10. | With neat P-v and T-s Plots. Derive the expression for the Pressure Ratio for a two-stage air compression with intercooling for minimal compression work. Also define the isentropic efficiency of the compressor. | L2 | Understanding |
| 11. | The compressor of a large gas turbine inducts air at 95 kPa and $15^{\circ} \mathrm{C}$ at the rate of $50 \mathrm{~m} 3 / \mathrm{sec}$ and exits at 1.2 MPa . The compression process is essentially adiabatic and changes in Kinetic and Potential energies are negligible. Calculate the power required to drive this compressor and the exit temperature assuming that the process is reversible and the compressor has an isentropic efficiency of $87 \%$. | L3 | Apply |
| 12. | Calculate the heat flowing through a furnace wall 0.23 m thick, the inside and outside surface temperatures of which are $1000^{\circ} \mathrm{C}$, and $200^{\circ} \mathrm{C}$ respectively. Assume that the mean thermal conductivity of the wall material is $1.1 \mathrm{~W} / \mathrm{mK}$. Assuming that 7 mm of insulation ( k $=0.075 \mathrm{~W} / \mathrm{mK}$ ) is added to the outside surface of the wall and | L3 | Apply |

|  | reduces the heat loss $20 \%$; calculate the outside surface temperature <br> of the wall. If the cost of the insulation is Rs. 70 per sq $m$. What time <br> will be required to pay for the insulation? Base the calculations on <br> the 24 hours operation per day and 199 days per year. Heat energy <br> may be valued at Rs. 10 per 1000 kWh. |  |  |
